

TOUR MANAGER (TM)

TOUR MANAGEMENT

Tour Manager (TM) is a comprehensive, fully integrated, enterprise tour management software solution designed by Enghouse's tour industry experts. As a user friendly and cost effective solution, TM is a tool that not only increases productivity and the bottom line, but also enhances customer service.

TM is an end-to-end software package that manages:

- Retail tours and scheduled departures
- Pre-formed groups
- Fly-drives and cruises
- FIT

TM helps you perform all your tour management tasks, while tracking data pertaining to vendors, customers, general ledger accounts, reservations, to-do lists, contracts and tour marketing information.

BENEFITS

Increased Departmental Efficiency

TM incorporates a wide range of tools that enable users to manage all aspects of the business, including client and master file database management, tour planning, pricing, booking, and scheduling. TM also functions as a workflow application to generate and distribute client itineraries, schedules, vendor purchase orders, and invoices.

Affordable Marketing Integration

TM's robust marketing tools empower your business to drive new sales and to address client needs. TM can generate personalized or mass mailings, such as newsletters and e-mails regarding current or future promotions. The effectiveness of your marketing programs can then be tracked within TM.

Profit Monitoring

Built right into TM is a complete break-even analysis tool set, which monitors all packages and components to ensure the highest levels of profits in real time, down to the individual reservation level.

Flexible Architecture

TM's flexibility enables full integration with any financial software package. With one click, TM can populate your financial software with the general ledger entries of all transactions, thereby greatly reducing manual entries and errors.

Database Accuracy & Organization

Our open database design provides an accurate data backbone that enables complete data tracking and the most robust industryspecific reporting capabilities available. TM continuously monitors current and future inventory levels and minimizes over and underbooking.

Detailed Audit Logs

All database entries are stamped with time, date and user information to provide a complete audit trail of transactions.
